Kevin Blaue

Backend / Cloud Software Developer | Architecture | AWS | TypeScript | Cross-Team Delivery

Architecture and delivery brief for backend, cloud, platform, and related software engineering roles in Canada.

Work authorization: based in Calgary, AB, with a Canadian IEC open work permit. Available now; no employer sponsorship required.

POSITIONING

Backend-focused Software Developer with 6+ years of software development experience, including nearly 4 years full-time, building cloud services, APIs, authentication solutions, and production systems. Most recently served as the department's sole engineering representative in a core architecture group of about 10 members at freenet and owned the company's first BFF for two consumer brands. Previously contributed to six serverless backends across 18 AWS accounts.

RECENT ARCHITECTURE AND DELIVERY OWNERSHIP

Architecture Governance
Selected as the department's sole engineering representative in a core Architecture Management Group of about 10 members.

First BFF Ownership
Designed the company's first BFF for freenet and Klarmobil across QA and production, intended for campaigns reaching up to 500,000 customers.

IAM Platform Work
Developed and maintained central Auth0 login and authorization services for freenet and Klarmobil, integrated by the customer-portal frontend team.

BACKEND FOR FRONTEND - END-TO-END SCOPE

Architecture:	Designed the two-tenant BFF architecture for freenet and Klarmobil, aligned it with internal standards, wrote the technical documentation, and defended the concept in architecture governance.
Planning:	Turned the approved concept into actionable Jira tasks and coordinated sequencing and distribution with the frontend team's Product Owner.
Cross-team delivery:	Worked directly with 2–3 frontend engineers, coordinated DNS and Cloudflare routing dependencies, and acted as the main technical contact for the consuming team.
Handover:	Taught API Gateway, Lambda, monitoring, and manual development deployments so the frontend team could maintain and extend the BFF independently before go-live.

SELECTED EARLIER DELIVERY SIGNALS

- Contributed to six serverless AWS backends across 18 development, QA, and production accounts, with substantial contributions to four services.
- Helped build an hourly Glue pipeline that processed about 1 million Austrian and Swiss store-order records in six months and made physical-store purchases visible in customer online accounts.
- Introduced Datadog and CloudWatch monitoring across all six backends in QA and production, linking metrics with logs to simplify incident investigation.
- Led the Apple Wallet implementation for the online-account platform; onboarded two engineers and supported a third through the company buddy program.

AI-ASSISTED ENGINEERING

Use AI to accelerate analysis, implementation, debugging, and review while retaining full responsibility for technical decisions. Generated solutions are evaluated for correctness, architectural fit, maintainability, security, and long-term sustainability; poor or over-engineered approaches are challenged and refined.
